

A NEW SPECIES OF THE GENUS ASTRAGALUS, SECT.
TRICHOLOBUS (LEGUMINOSAE) FORM IRAN

A.A. Ramak Maassoumi, A. Ghahreman & V. Mozaffarian

Ramak Maassoumi, A.A., Ghahreman, A. & Mozaffarian, V.: 1988.
12 . 31: A new species of the genus *Astragalus*, sect. *Tricholobus*
(*Leguminosae*) from Iran. -- *Iran. journ. Bot.* 4(1): 109 – 110.

Astragalus magistratus is described from Semnan area as a new to
the science. It is characterized in having globose inflorescence with
long and thin peduncle and linear or setaceous calyx teeth.

of Biology, Tehran, Iran.

گونه جدیدی از جنس گون (Astragalus) از سمنان

از: علی‌اصغر رمک معصومی، احمد قهرمان و ولی‌الله مظفریان

گونه *Astragalus magistratus* بعنوان گونه جدیدی از علم گیاهشناسی
از منطقه سمنان نامگذاری و معرفی می‌شود. این گونه با داشتن گل آذین سرسان با
پایک بلند و نازک و همچنین کاسیرگهایی با دندانه‌های خطی و یا نخی شکل
مشخص می‌گردد.

Introduction

In a short botanical excursion in Semnan region by two authors (Ghahreman & Mozaffarian), one interesting species belong to the genus *Astragalus* was collected. This species by its distinctive characters was recognized as a new species by another author (Maassoumi), which is described here as *A. magistratus*. This species by its characteristics is immediately distinguishable. It is close to *A. hohenackeri*, but separable in some botanical respects.

***Astragalus magistratus* Maass., Ghahreman & Mozaffarian, Sp. nov.**

(Sect. *Tricholobus*)

Plantae perennes suffruticosae, 10–12 cm longae, caudes multiceps, crassus, dense rachidibus foliolis praecedentibus. Stipulae ovatae ca. 1 mm longae, glabrae, margine ciliatae, apicem versus abrupte attenuatae, apice mucronatae vel pungentiae. Folia 1–2 cm longa. Foliola paripinnata, 4–6 juga; foliola terminalia brevissime spinosa, pungenta; foliola lateralia oblongo-elliptica, 4 mm longa et 1 mm lata, complicata, apice obtusa, basi attenuata, utrinque subpatenter

pilosa. Inflorescentiae globosae, longe pedunculatae, pedunculo 6–7 cm longo, dense subpatenter piloso. Bracteae lineares, ca. 13 mm longae, longe sericeo-hirsutae. Calyx campanulatus vel infundibularis, 14 mm longus; dentibus linearibus vel setaceis, apice mucronatis, quam tubo aequantibus. Corolla violacea (in vivo) demum brunnea. Vexillum 12 mm longum; lamina ovata, in parte mediano ca. 5 mm lata, apice retusa vel leviter emarginata, basi in unguo attenuata. Alae 12 mm longae; lamina elliptica, apicem versus breviter dilatata, antice rotundata, basi breviter auriculata, ungue lamina duplo longiore. Carina 10 mm longa; lamina elliptica, dorso curvata, apice acuta, basi auriculata, ungue lamina duplo longicre. Ovarium pilosum, basi breviter stipitatum. Legumen ignotum.

Typus: Semnan: Between Semnan and Damghan, Ahevan pass, 15.6.1987, 1700 m, Ghahreman & Mozaffarian, 58936 (Holotypus TARI; Isotypus THU).

The new species by globose inflorescence, long and thin peduncle and linear or setaceous calyx teeth is distinguishable.
