

A NEW SPECIES AND A NEW RECORD OF HIERACIUM L. (ASTERACEAE) FROM IRAN

Z. Tavakkoli & M. Assadi

Tavakkoli, Z. & Assadi M. 2005 07 01: A new species and a new record of *Hieracium* L. (Asteraceae) from Iran. -*Iran. Journ. Bot.* 11 (1): 59-63. Tehran.

Hieracium piranshahricum is described as a new species from Iran. *H. longiscapum* is reported as a new record for the flora of Iran. They belong to the section *Pratensina* and subsection *Pratenses*. *H. piranshahricum* is compared with its close relative *H. longiscapum*,

Zahra Tavakkoli, Department of Biology, Training University of Tehran, Iran. - Mostafa Assadi, Research Institute of Forests and Rangelands, P.O.Box. 13185-116, Tehran, Iran.

Key words. *Hieracium*, Asteraceae, new species, new record, Iran.

یک گونه جدید و یک گزارش جدید از جنس **Hieracium** در ایران

زهرا توکلی و مصطفی اسدی

گونه *H. piranshahricum* به عنوان گونه جدید از ایران معرفی می‌گردد. این گونه متعلق به بخش sect. *Pratensina* subsect. *Pratenses* است و با گونه *H. longiscapum* قرابت زیادی دارد. در گونه *H. longiscapum* ساقه با کرک‌های ستاره‌ای و غده‌ای، دمگل آذین و برگ‌های گریبان با کرک‌های غده‌ای، تعداد برگ‌های قاعده‌ای ۲-۴ و مستطیلی، برگ‌های ساقه‌ای ۱ (۲-)، تعداد کپه‌های گل آذین ۱۰-۲، برگ‌های ناحیه گل آذین تیره با حاشیه باریک سفید، جام گل در هر دو سطح زرد است، اما در گونه *H. piranshahricum* ساقه بدون کرک ستاره‌ای و غده‌ای، دمگل آذین و برگ‌های گریبان بدون غده، تعداد برگ‌های قاعده‌ای ۱۳ و واژنیزه‌ای، برگ‌های ساقه‌ای ۷، تعداد کپه‌های گل آذین تقریباً ۳۳، برگ‌های ناحیه گل آذین سبز با حاشیه پهن غشایی، جام گل زرد و در سطح خارجی قرمز - بنفش می‌باشد. گونه *H. longiscapum* برای اولین بار از ایران گزارش می‌شود.

INTRODUCTION

The first author has studied *Hiercium* genus in TARI, IRAN and FAR herbaria for the preparation of Flora of Iran (Assadi 1989). In this paper a new species is introduced and a species is reported for the first time from Iran.

NEW SPECIES

Hieracium piranshahricum Tavakkoli & Assadi, sp. nov.

Planta perennis. Caulis ca. 90 cm longus, 3.5-4 mm diam.; pili 3-4 mm longi, inferne paulo densi et dilute flavi, superne dispersi. Folia basalia 13, 7-120 × 8-15 mm, oblanceolata, acuta vel obtusa, integra, laete viridia, pilis 1-5 mm longis dispersis. Folia caulina 7, lanceolata, acuta, versus apicem gradatim decrescentia. Stolones usque ad 26 cm longi, foliis 12-13; folia 10-40 × 4-12 mm, oblonga, acuta. Inflorescentia laxae paniculate corymbosa, capitulis 33. Pedunculi atrovirides, pili dispersis, eglandulosi, pilis stellati in stato juveni dense praediti. Folia floralia 2-7 mm longa, linearia, late membranacea vel interdum omnino membranacea, moderate pilosa; pili 1-2.5 mm longi. Involucra 6-8 mm longa, cylindraceo-obovata; phyllaria linearolanceolata, acuta, dilute viridia ad medianum atroviridia, ad marginem membranacea; pili ad basem nigri 1-2 mm longi, eglandulosi; pilis stellati superne dispersi, inferne densi. Ligula flava, externe rubro-purpurascens et pilosa. *Typus*. Kordestan: 8 km North of Mirabad on road to Piranshahr, close to big river, 1300-1400 m, Runemark & Mozaffarian 29175 (holotypus TARI).

Plant perennial. Stem ca. 90 cm high, 3.5-4 mm in diam.; hairs 3-4 mm long, rather dense and pale yellow below, scanty above with black-base; stellate hairs and glands absent. Basal leaves 13 in number, 70-120×8-15mm, oblanceolate, acute or blunt, entire, pale-green, with scanty hairs 1-5 mm long on both sides; stem leaves 7 in number, lanceolate, acute, gradually decreasing upwards. Stolons up to 26 cm long, with 12-13 leaves; leaves 10-40×4-

12 mm, oblong, acute. Inflorescence loosely-paniculate-corymbose, with 33 capitules; peduncles dark-green, with scanty hairs, eglandular, with dense stellate hairs when young. Floral leaves 2-7 mm long, linear, broadly membranous or sometimes totally membranous, moderately hairy; hairs 1-2.5 mm long. Involucres 6-8 mm long, cylindrical-obovate; Involucral bracts linear-lanceolate, acute, light-green but dark-green at the middle, membranous at the margin, moderately hairy; hairs black at the base, 1-2 mm long, eglandular; stellate hairs scanty above, dense at the base. Ligule yellow, red-purple and hairy outside.

H. piranshahricum belongs to the section *Pratensisina* Asch. et Graebn. subsection *Pratenses* Juxip and is related to *H. longiscapum* Boiss. et Kotschy. They are compared in table 1.

NEW RECORD

Hieracium longiscapum Boiss. et Kotschy Mazandaran: Polesefid, Sangdeh, Ashak, 1600-2600 m, Assadi 73592.

This species with soft and compressed stem belongs to the section *Pratensisina* Asch. et Graebn. It was originally described from Asia minor, but later the distribution of the species extended to Caucasica (Sell & West 1975; Juxip 1960). The species was mentioned from Iran in geographical distribution of the species in Flora of the USSR, (Juxip 1960) with a question-mark. It seems this collection is the first collection of the species from Iran.

Table 1. Comparison of *Hieracium piranshahricum* and *H. longiscapum*.

Characters	<i>H. longiscapum</i>	<i>H. piranshahricum</i>
Stem length	20-35 cm	90 cm
Stem diameter	1-2 mm	3.5-4 mm
Stem indumentum	hairs 2-3 mm, dense below, with scanty stellate hairs and glands above	hairs 3-4 mm, rather dense below, without stellate hairs and glands
Stolon	up to 10 cm, with 4-5 leaves	up to 26 cm, with 12-13 leaves
Basal leaves	2-4 in number, oblong	13 in number, oblanceolate
Stem leaves	1(-2) in number	7 in number
Number of capitules	2-10	33
Glands of peduncles and involucres	glandular	eglandular
Floral leaves	dark, with narrow white margin	green, broadly membranous at the margin
Ligule	yellow on both sides	yellow, red purple outside
