Sherqulova, J. P., Mustafaev, I. M., Iminova, M. M. & Sattorov, A. S. 2019. 06. 30: Species, host range and geographical distribution of microfungi (Dothideomycetes) on introduced trees and shrubs in southern Uzbekistan. - *Iran. J. Bot.* 25 (1): 72-78. Tehran.

A comprehensive review of the species, host ranges and geographical distribution of microfungi (Dothideomycetes) on introduced trees and shrubs in southern Uzbekistan are presented. The listed 31 species of Dothideomycetes microfungi belonging to 11 genera, 7 families and 3 orders are recorded in Southern Uzbekistan. From them 2 species (*Camarosporium meliae* Annal, *Pleospora spegazziniana* Sacc, are reported for the first time from Uzbekistan. According to our results these fungi are recorded on 25 host plant species.

Jamila Payanovna Sherkulova (correspondence< j.shirkulova@mail.ru>), department of microbiology and biotechnology, Karshi State University, Uzbekistan.- Ilyor Muradullayevich Mustafaev & Malika Mashrabovna Iminova, Laboratory of Mycology and algology, Institute of Botany, Academy of Sciences of the Republic of Uzbekistan.- Abdumurod Sattorovich Sattorov, Termiz Stste Universty, Republic of Uzbekistan.

مروری جامع بر روی گونه‌های قارچ‌های میکروسکوپی Dothideomycetes بر روی درختان و درختچه‌های غیربومی ازبکستان ارایه می‌گردد.
لیست ۳۱ گونه قارچ میکروسکوپی گروه Dothideomycetes متعلق به یازده جنس و ۷ خانواده و ۳ راسته از جنوب ازبکستان گزارش می‌گردد.
از میان آنها دو گونه شامل *Camarosporium meliae* Annal, *Pleospora spegazziniana* Sacc. برای اولین بار از ازبکستان گزارش می‌گردد.
براساس نتایج ما این قارچ‌ها از روی ۲۵ گیاه میزبان گزارش می‌گردند.

INTRODUCTION

The territory of Southern Uzbekistan includes the Kashkadarya and Surkhandarya regions that are located in the south of Central Asia. It borders in the north with the Samarkand and Bukhara regions of Uzbekistan, in the east with Tajikistan, in the west with Turkmenistan, and in the south Afghanistan. The southern boundary of

the region runs along the Amu Darya River, which is the border between Uzbekistan and Afghanistan. Southern Uzbekistan covers 48,500 km² (18,800 sq miles).

Dothideomycetes are a largest class of the phylum Ascomycota with 19000 species belonging to 1300 genera, 11 orders and 90 families (Kirk & al., 2008).

The best known members of this class are several important plant pathogens (like *Phaeosphaeria nodorum* and *Venturia inaequalis*). However, a majority of described species are either found as endophytes or saprobes growing on woody debris, decaying leaves or dung (Nelsen & al., 2009).

In the territory of southern Uzbekistan grow 215 species of introduced plants belonging to 113 genera and 52 families (Yoziev, 2001).

Studies on microfungal biota of Uzbekistan were first started by Zaprometov (1926, 1928) and followed by Golovin (1947, 1949a,b, 1950); Kleiner (1958); Lebedeva (1958); Gaponenko (1959, 1965); Baymuratova (1963); Panfilova & Gaponenko (1963); Sagdullaeva (1965); Usmonov (1965); Axmedova (1966); Kravcova (1969); Kirgizbaeva (1972); Kuchmi (1970); Nazarov (1971); Eshonkulov (1973); Ibadov (1973); Gulyamova (1975); Ramazanova (1975); Shtok (1982); Zuparov (1984); fungal flora of Uzbekistan 1990-1997; Kamilov (1991); Khasanov (1992); Xolmurodov (1994); Sherzaliev (2001); Solieva & Gafforov (2001); Solieva & al. (2007); Nuraliev (1999); Gafforov (2016, 2017). However, diversity of fungi on introduced plants in Southern Uzbekistan has not studied.

MATERIALS AND METHODS

Between 2014 and 2017 the intensive study of microfungi, samples were collected from various introduced woody and shrubby plants in Karshi, Shakhrisabz and Termez cities (Southern Uzbekistan). Samples were dried at room temperature in paper bags and were deposited in Tashkent mycological herbarium (TASM) of the Institute of Botany and Zoology (IBZ). The main method of identifying the species of fungi was light microscopy, carried out according to standard procedures. Measurements were made from slide stained preparations observed under a Motic BA410 light microscope in the Mycology Laboratory of the IBZ. Species identification was performed according to Morochkovski & al., 1969, 1971, Juravlev & al. 1979, Conrad & al., 2009. Fungal names are given in accordance with <http://www.mycobank.org>, host plants are given with <http://www.theplantlist.org>. New records of Dothideomycetes species for Uzbekistan, were shown by asterix (*).

RESULTS

A total of 31 species of Dothideomycetes microfungi belonging to 11 genera, 7 families and 3 orders were recorded in Southern Uzbekistan. According to our results these fungi recorded 25 host

plant species. However, it is expected that more collections and further taxonomic studies will substantially increase our knowledge on the presence of these fungi in Southern Uzbekistan.

Taxonomy

Ascomycota (Berk.) Caval. -Sm.

Pleosporales Luttrell ex M.E. Barr

Pleosporaceae Nitschke

Alternaria Nees
